1. INTRODUCTION

The *Guide to Machinery Costs* is compiled to assist farmers, extension personnel and others involved in costing farm operations, and machinery decision making. These costs are updated annually and are based on available technical and financial data, in particular prices published in *Agfacts*. Prices of agricultural machinery vary between firms and regions.

The performance of machines also varies under different working conditions. It is therefore important that the user interprets these costs intelligently for a particular region, or set of circumstances.

It is important to note that many machines are no longer available on the market, while new machines have entered the market. Equipment marked with an asterisk (*) represents an alternative/higher price for the implement in question, while equipment which is no longer available is marked with a double asterisk (**). The price of this equipment is increased by an appropriate percentage based on the previous year's price, and this equipment will not be listed in the following years. An adjustment to the expected lifespan of the equipment is made from time to time, based on information received from researchers, manufacturers and users of equipment. Any information of this nature is welcome, together with any constructive criticism which can assist in improving this publication.

Compilation of the *Guide to Machinery Costs* would not have been possible without the valuable assistance of the manufacturers and suppliers of agricultural machinery, who have kindly provided the necessary technical and financial information.

The initial computer programs were developed by Messers K.P. Archibald and G.F. Ortmann, formally of the Division of Agricultural Production Economics—Natal region. These programs were converted into an IBM compatible micro-computer version by Mr. R.J. Gordijn, and further adapted by Mr P.A. Gordijn and Mr J.C. Mentz. This version was converted into Excel by Ms P.C. Pennefather. Further modifications and enhancements have been made by Ms C.G. Archer. The guide has been updated this year by Mr P.A. Lubbe, (Department of Agriculture, Forestry and Fisheries), and Ms C.G. Archer, (KwaZulu-Natal Department of Agriculture). Past valuable contributions have been made by Mr E.N.C. Whitehead and Mr P.J. Burger.

1.1 Notes on machinery costs

The costs of owning and operating machinery can be divided into two categories, namely fixed costs and variable costs.

Fixed costs are related to machinery ownership and occur regardless of whether the machinery is used or not. Fixed costs per hour of usage are inversely proportional to the extent of annual usage. Variable costs relate directly to the degree of utilisation of the machine and include factors such as repairs and maintenance costs, fuel and lubricants.

The division into fixed and variable costs is not always an absolute one. There is a valid argument for considering depreciation charges as being made up of two main components, one of which is determined by obsolescence and is a fixed cost, and the other relates to "wear and tear" and is considerably influenced by the use of the machine. In this case depreciation could be considered to be a variable cost.

The cost figures in this *Guide to Machinery Costs* are AVERAGE figures excluding the current Value Added Tax, at the month of updating. They are based on the assumed life expectancies and annual usage, obtained from studies done in South Africa, Great Britain and the U.S.A. According to Culpin (1959), it is injudicious to assume a life expectancy beyond 15 years for any implement or machine. These figures are therefore suggested, and serve as a guideline where specific information is unavailable.

1.1.1 Depreciation

Depreciation is the reduction in value of a machine with the passage of time. There are various methods of calculating depreciation costs. The straight-line method gives a constant annual charge for depreciation throughout the lifespan of the machine, and this is the method used in the *Guide to Machinery Costs* to calculate the depreciation costs.

1.1.2 Interest

A charge for interest is included as a fixed cost because the money which is invested in machinery could have been invested in other productive enterprises or investments. The interest rate that is used in the *Guide to Machinery Costs* is the interest rate that can be obtained on a medium-term (5 year) investment.

The value of the machine decreases over time as reflected by annual depreciation charges. Consequently, the amount of money invested in the machine decreases, from the initial purchase price to the scrap value at the end of the machine's useful life. The interest charge takes this into account as it is based on the average investment during the lifespan of the machine.

1.1.3 Insurance and licence

These costs are based on current charges imposed by various insurance companies and the government. In some instances, insurance and licence charges are assumed to be a percentage of the average investment of the machine.

1.1.4 Repairs and maintenance

These costs are difficult to estimate as they vary greatly, depending on operating conditions, management, maintenance programmes, local costs, etc. It is generally agreed that repair costs will increase with age but are unlikely to increase proportionally. Repair costs per hour of use will increase with age but will tend to level off as the machine becomes older (Kepner et.al., 1978, p. 36).

Accurate estimates of repair costs are not easily obtainable. However, work done by the Directorate of Agricultural Engineering has been used where appropriate (see Reference 4). Repair costs are quoted as a percentage of the purchase price of the machinery, divided by the annual use. The percentages are kept constant over the lifespan of the machine, thereby obtaining an average cost during the machine's useful life. There are disadvantages to this method, however for general reference purposes it is the most practical method.

For further information on repairs and maintenance cost formulae consult the reference list, with particular attention to references 1 and 6.

1.1.5 Fuel

Fuel consumption is also a contentious issue and can vary greatly for different areas, machines and even operators. Here again, these figures are based on the results of surveys done in South Africa and the U.S. For further information consult references 1, 5 and 6.

There are three levels of power demand for tractors—light, medium and heavy—depending on the type of work being done. The fuel consumption is in litres per kW-hour and varies for each level of power demand. There is also a variation in the percentage of available kW that is used at each level. (See notes at the foot of each page.)

A single level of power demand is used for self-propelled combine harvesters. The fuel consumption is in litres per kW-hour and varies with the engine power (kW).

In the case of LDVs and trucks, the fuel usages per 100 km are the average figures supplied by the dealerships and manufacturers' standards. Clearly these consumption figures will vary for different vehicles, drivers and circumstances in general. The listed fuel usage figures are for information purposes only, and users of the guide have to adjust the fuel costs if their consumption figures are noticeably different.

The prices of diesel, petrol and oil were those prevailing on the highveld at the time of updating the guide. Users may need to adjust the fuel costs if current prices are significantly different from those used in the guide.

(See notes at the foot of each page.)

1.2 Cost per hectare

The following remarks have to be kept in mind concerning the costs of using tractors and implements.

- 1) The driver/operator and labour costs are not included in the listed costs
- 2) The costs of materials (e.g. baling twine, wire, seed, fertiliser) are not included in the listed costs.

1.2.1 Cost per unit of measure

Machinery costs included in this guide are listed below, together with the unit of measure.

Tractors	R/hour	(R/hr)	The cost per hour is based on clock hours and not tractor hours.
Implements	R/hour	(R/hr)	
Self-propelled combine harvesters	R/hour	(R/hr)	
Trailers	R/hour	(R/hr)	
LDVs	Cents/kilometre	(c/km)	
Trucks	Cents/kilometre	(c/km)	
Electric motors	R/Hour	(R/hr)	

If the necessary conversion factors are available, these costs can be translated into the cost per hectare, per ton, etc.

1.2.2 Duration time per hectare and per kilometre

The duration time per hectare depends upon the working width of an implement, the work speed, and the effectiveness of the machinery being used to carry out an activity. The following formula can be used to calculate the duration time per hectare:

$$\text{Duration per hectare } \left(\frac{\text{hr}}{\text{ha}} \right) = \frac{10\,000}{[\text{work width (m)} \times [\text{work speed } \left(\frac{\text{Km}}{\text{hr}} \right) \times 1\,000] \times \text{effectiveness (\%)}]}$$

To calculate a Rand per hectare value, information is required on the time requirement of the machine per hectare. Some rough guidelines to these figures are reported in the "Field Capacities" section at the end of this publication. Take note that this figure will largely depend on the shape of the field, speed of the machine, area, etc.

In the case of vehicles, cane and timber equipment, the duration time is given by the following formula:

$$\text{Duration per kilometer } \left(\frac{\text{hr}}{\text{Km}} \right) = \frac{1}{[\text{average speed } \left(\frac{\text{Km}}{\text{hr}} \right)]}$$

In other words, the duration time per kilometre is the inverse of the average speed.

1.2.3 Cost per hectare

To determine costs per hectare from the data in the *Guide to Machinery Costs*, the following formula can be used:

$$\text{Costs per hectare (R/ha)} = \text{Cost per hour (R/hr)} \times \text{Duration time per hectare (hr/ha)}$$

In other words, the duration time of the activity (e.g. ploughing, spraying, fertilising) is multiplied by the cost per hour.

The cost per hour will be that of the tractor, plus the cost of any implement used with the tractor to perform the activity (e.g. tractor and plough, tractor and boom sprayer, tractor plus trailed combine harvester). The cost of a self-propelled combine harvester will replace the cost of the tractor when appropriate.

The costs per ton (unit of yield) can be determined by using the following formula:

$$\text{Costs per ton (R/ton)} = \text{Cost per hectare (R/ha)} \div \text{Tons per hectare (ton/ha)}$$

$$\text{Costs per ton (R/ton)} = \text{Cost per hectare (R/ha)} \times \text{Hectare per ton (ha/ton)}$$

The following tables give some indication of how the information in the guide can be used to determine the costs of using equipment to perform a range of farming activities. Fixed costs are the total of depreciation, interest, licence and insurance. Variable costs consist of repairs and maintenance, fuel and oil, and tyres. No labour costs are included in these examples. Cost per hour is based on clock hours and not tractor meter hours. The costs in the following tables are taken from the *Guide to Machinery Costs 2013/14*.

TABLE 1: Tractor and implement

a) Activity duration times

Activity	Tractor			Implement			Duration	
	Power (kW)	Drive (2W/4W)	Power demand (L/M/H)	Description	Working width (m) (A)	Working speed (km/hr) (B)	Effectiveness (%) (C)	(hr/ha) (= 10 000 ÷ (A x B x 1 000 x C/100))
Plough	98	4W	H	3-furrow disc plough	2,6	2,6	85	1,74
Plant	63	4W	M	3-row (1,5 m) maize planter	1,5	3,0	85	2,61
Fertilise	63	4W	M	4 000 ℥ double-disc fertiliser spreader	3,2	3,2	85	1,15
Spray	63	4W	L	12 m boom sprayer	12	6,0	85	0,16

b) Activity costs per hour and per hectare

Activity	Duration (hr/ha) (A)	Tractor		Tractor costs			Implement		Implement costs			Total costs	
		kW 2/4W	Power demand (L/M/H)	Fixed (R/hr)	Variable (R/hr)	Total (R/hr) (B)	Description	Fixed (R/hr)	Variable (R/hr)	Total (R/hr) (C)	Per hour (D = B + C)	Per ha (D x A)	
Plough	1,74	98 4W	H	77,35	292,96	370,31	3 furrow disc plough	13,73	10,41	24,14	394,45	686,34	
Plant	2,61	63 4W	M	51,85	171,14	222,98	3 row (1,5 m) mtd. maize planter	49,25	27,17	76,42	299,41	781,46	
Fertilise	1,15	63 4W	M	51,85	171,14	222,99	4 000 ℥ double-disc fert. spreader	459,22	308,43	767,65	990,64	1 139,24	
Spray	0,16	63 4W	L	51,85	156,51	208,36	12 m mtd. (1 000 ℥) boom sprayer	27,38	9,44	36,82	245,18	39,23	

This information indicates that it costs R394,45/hour to plough using a 98kW (4-wheel) drive tractor which is pulling a 3 furrow disc plough, assuming that ploughing is a heavy operation. It indicates that it costs R781,46 to plant one hectare using a 63kW (4-wheel) drive tractor which is pulling a 3-row (1,5 m) mounted planter, assuming that planting is a medium operation, and it takes 2,61 hours to plant one hectare. No costs are included for labour, or seed and other materials.

TABLE 2: Self-propelled combine harvester—maize

a) Activity duration time

Activity	Combine details					Duration	
	Engine size (kW)	Description/head size and row size		Working width (m) (A)	Working speed (km/hr) (B)	Effectiveness (%) (C)	(hr/ha) (= 10 000 ÷ (A x B x 1 000 x C/100))
Harvest	207	8-row 0,9 snapper maize combine		7,2	5,0	90	0,309
Harvest	313	12-row 0,9 snapper maize combine		10,8	6,0	90	0,171

b) Activity costs per hour and per hectare

Activity	Duration (hr/ha) (A)	Engine size (kW)	Engine costs			Description/head size and row size	Head costs			Total costs	
			Fixed (R/hr)	Variable (R/hr)	Total (R/hr) (B)		Fixed (R/hr)	Variable (R/hr)	Total (R/hr) (C)	Per hour (D = B + C)	Per ha (D x A)
Harvest	0,309	207	710,73	6 66,57	1 377,30	8-row 0,9 snapper head	212,78	51,53	264,31	1 641,61	507,26
Harvest	0,171	313	1 357,34	1 076,35	2 433,69	12-row 0,9 snapper head	384,78	93,29	477,96	2 911,65	497,89

TABLE 3: Self-propelled combine harvester—wheat

a) Activity duration time

Activity	Combine details						Duration	
	Engine size (kW)	Description/head size and row size	Working width (m) (A)	Working speed (km/hr) (B)	Effectiveness (%) (C)	(hr/ha)	(= 10 000 ÷ (A x B x 1 000 x C/100))	
Harvest	146	6,0 m wheat combine		6,0	5,0	90	0,370	
Harvest	216	9,1 m wheat combine		9,1	5,0	90	0,244	

b) Activity costs per hour and per hectare

Activity	Duration (hr/ha) (A)	Engine size (kW)	Engine costs			Description/head	Head costs			Total costs	
			Fixed (R/hr)	Variable (R/hr)	Total (R/hr) (B)		Fixed (R/hr)	Variable (R/hr)	Total (R/hr) (C)	Per hour (D = B + C)	Per ha (D x A)
Harvest	0,370	146	495,50	468,74	964,24	6,0 m wheat combine	148,79	36,04	184,83	1 149,07	425,16
Harvest	0,244	216	1 049,00	769,98	1 818,98	9,1 m wheat combine	188,17	45,57	233,74	2 052,72	500,86

TABLE 4: Truck

a) Activity duration time

Activity	Truck details				Average speed			Duration		
	Description		Capacity (ton) (A)	km/hr (B)	hr/km (C = 1 ÷ B)	km/hr.ton (D = B ÷ A)	hr/km.ton (E = C ÷ A)			
Transport 8 t grain	8,0 t single-differential truck		8,0	80,0	0,0125	10,00	0,0016			

b) Activity costs per kilometre, per hour, and per ton

Activity	Truck description	Truck costs		Total costs			
		Fixed (R/km)	Variable (R/km)	R/km (F)	R/hr (G = F x B)	R/km.ton (H = F ÷ A)	R/hr.ton (I = F x D)
Transport 8 t grain	8,0 t Single-differential truck	2,31	6,69	9,00	720,00	1,13	90,00

These costs do not include the driver, or any other labour assistance.

Example: Assume that a maize farmer achieved a yield of 8t/ha on two hectares. He needs to transport 16 t of grain. He is using an 8,0 t single-differential truck, with an average speed of 80 km/hr. This means that two trips will have to be done. The total distance to be travelled for both return trips is 50 km. Using the tables above, as a guideline, the following costs can be derived.

c) Example: Truck activity costs

Activity	Tonnage transported (tons) (A)	Total distance travelled 2 loads (km) (B)	Truck 8 t single-diff. ton (C)	Truck cost (fixed + variable) R/km (D)	Average speed		Duration		Total costs			
					km/hr (E)	hr/km (F = 1 ÷ E)	km/hr. ton (G = E ÷ C)	hr/km.ton (H = F ÷ C)	R/km (D)	R/hr (I = D x E)	R/km.ton (J = D ÷ C)	R/hr.ton (K = I ÷ C)
Transport 8 t grain	16,0	50,0	8	9,00	80,0	0,0125	10,00	0,00156	9,00	720,00	1,13	90,00

$$\text{The total distance travelled} = 50 \text{ km} \quad (\text{B})$$

$$\text{The total cost per kilometre (R/km)} = \text{R } 9,00 \quad (\text{D})$$

$$\text{The total cost of the return trip} = \text{R } 450,00 \quad (\text{L} = \text{B} \times \text{D})$$

$$\text{Tonnage transported} = 16 \text{ tons} \quad (\text{A})$$

$$\text{Cost per ton} = \text{R } 28,13 \quad (\text{M} = \text{L} \div \text{A})$$

$$\text{The 16 t maize grain yield was from} = 2 \text{ ha}$$

$$= 8 \text{ t/ha} \quad (\text{N})$$

$$\text{Cost per hectare} = \text{R } 225,00 \quad (\text{M} \times \text{N})$$

TABLE 5: Tractor and trailer

a) Activity duration time

Activity	Tractor			Trailer			Average speed		Duration	
	Power (kW)	Drive (2W/4W)	Power demand (L/M/H)	Description	Capacity (ton) (A)	km/hr (B)	hr/km (C = 1 ÷ B)	km/hr.ton (D = B ÷ A)	hr/km.ton (E = C ÷ A)	
Transport grain	98	4W	H	10 t 4-wheel trailer with dropsides	10,0	10,00	0,10	1,00	0,01	

b) Activity costs per hour, per kilometre, and per ton

Activity	Tractor	Tractor costs			Trailer			Trailer costs			Total costs			
	kW; 2/4 W; L/M/H	Fixed (R/hr)	Var. (R/hr)	Total (R/hr) (F)	Description			Fixed (R/hr)	Vari. (R/hr)	Total (R/hr) (G)	R/hr (H = F + G)	R/km (I = H x C)	R/hr.ton (J = H ÷ A)	R/km.ton (K = I ÷ A)
Transport	98 4W; H	77,35	292,96	370,32	10 t 4-wheel Trailer with dropsides			24,60	13,47	38,07	408,39	40,84	40,84	4,08

Example: Assume that a maize farmer has to transport 10 tons of maize from the field to the silo. He is using a 98kW (4-wheel) drive tractor and a 10 t 4-wheel trailer (with dropsides), with an average speed of 20 km/hr. This means that one trip will have to be undertaken. The total distance to be travelled from the field to the silo is 10 km. Using the tables above, as a guideline, the following costs can be derived.

c) Example: Tractor and trailer activity costs

Activity	Tonnage transported (tons) (A)	Total distance travelled (km) (B)	Tractor	4 W Trailer	Average speed		Duration		Total costs					
			98 4W; H	10 ton (D = 10)	Total cost R/hr (C)	Total cost R/hr (E)	km/hr (F)	hr/km (G = 1 ÷ F)	km/hr.ton (H = F ÷ D)	hr/km.ton (I = G ÷ D)	R/hr (J = C + E)	R/km (K = J x G)	R/hr.ton (L = J ÷ D)	R/km.ton (M = K ÷ D)
Transport 10 t grain	10,0	10,0	370,32	38,07	20,0	0,05	2,00	0,005	408,39	20,42	40,84	2,04		

The total distance travelled	=	10 km	(B)
The total cost per kilometre (R/km)	=	R20,42	(K)
The total cost of the trip	=	R 204,20	(N = B x K)
Tonnage transported (Yield)	=	10 tons	(A)
Cost per ton (R/T)	=	R20,42	(O = N ÷ A)
The 10 t maize grain yield was from		2 ha	
	=	5t/ha	(P)
Cost per hectare	=	R102,10	(O x P)

Other combinations of tractors, vehicles and equipment can be determined using the illustrations above.

It must be noted that the preceding examples do not include the costs of drivers and assistants. In the case of hay-making and baling operations, the cost of twine is not included.

Notes

- 1) Life period 12 000 hours
- 2) Average annual usage 1 000 hours
- 3) Salvage value 10% of purchase price
- 4) Average investment = (Purchase price + salvage value)/2
- 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
- 6) Insurance and licence cost per hour 1,75% of average investment/hours per annum
- 7) Interest cost per hour 8,5% of average investment/hours per annum
- 8) Repairs and maintenance cost per hour 120% of purchase price/life period in hours
- 9) Fuel price 13,27 per litre (as at 15/08/2013)
- 10) Fuel consumption 35% of Kilowatts used
- 11) Litres used per kilowatt hour 0,4 litre/kW hour
- 12) Where two prices are listed for tractors with the same kW rating, the higher price is for a tractor with a cab

2.2 Medium power demand

Tractor power (kW)	Purchase price (R)	Salvage value (R)	Average investment (R)	Depreciation (R/hr)	Licence and insurance (R/hr)	Interest (R/hr)	Total fixed costs (R/hr)	Total fixed costs – int. Notes

- 1) Life period 12 000 hours
- 2) Average annual usage 1 000 hours
- 3) Salvage value 10% of purchase price
- 4) Average investment = (Purchase price + salvage value)/2
- 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
- 6) Insurance and licence cost per hour 1,75% of average investment/hours per annum
- 7) Interest cost per hour 8,5% of average investment/hours per annum
- 8) Repairs and maintenance cost per hour 120% of purchase price/life period in hours
- 9) Fuel price 13,27 per litre (as at 15/08/2013)
- 10) Fuel consumption 60% of kilowatts used
- 11) Litres used per kilowatt hour 0,3 litre/kW hour
- 12) Where two prices are listed for tractors with the same kW rating, the higher price is for a tractor with a cab

3. FOUR-WHEEL DRIVE TRACTORS

3.1 Low power demand

Tractor power (kW)	Purchase price (R)	Salvage value (R)	Average investment (R)	Depreciation (R/hr)	Licence and insurance (R/hr)	Interest (R/hr)	Total fixed costs (R/hr)	Total fixed costs – int. Notes

- 1) Life period 12 000 hours
- 2) Average annual usage 1 000 hours
- 3) Salvage value 10% of purchase price
- 4) Average investment = (Purchase price + salvage value)/2
- 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
- 6) Insurance and licence cost per hour 1,75% of average investment/hours per annum
- 7) Interest cost per hour 8,5% of average investment/hours per annum
- 8) Repairs and maintenance cost per hour 120% of purchase price/life period in hours
- 9) Fuel price 13,27 per litre (as at 15/08/2013)
- 10) Fuel consumption 45% of kilowatts used
- 11) Litres used per kilowatt hour 0,35 litre/kW hour
- 12) Where two prices are listed for tractors with the same kW rating, the higher price is for a tractor with a cab

- Notes**
- 1) Life period hours—as per table
 - 2) Average use per annum hours/annum—as per table
 - 3) Salvage value 10% of purchase price
 - 4) Average investment = (Purchase price + salvage value)/2
 - 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
 - 6) Insurance cost per hour 1,5% of average investment/hours per annum
 - 7) Interest cost per hour 8,5% of average investment/hours per annum
 - 8) Repairs and maintenance cost per hour % of purchase price/life period in hours—as per table

- Notes 1) Life period hours—as per table
 2) Average use per annum hours/annum—as per table
 3) Salvage value 10% of purchase price
 4) Average investment = (Purchase price + salvage value)/2
 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
 6) Insurance cost per hour 1,5% of average investment/hours per annum
 7) Interest cost per hour 8,5% of average investment/hours per annum
 8) Repairs and maintenance cost per hour % of purchase price/life period in hours—as per table

10.5 Hay rakes and tedders

- Notes**
- 1) Life period hours—as per table
 - 2) Average use per annum hours/annum—as per table
 - 3) Salvage value 10% of purchase price
 - 4) Average investment = (Purchase price + salvage value)/2
 - 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
 - 6) Insurance cost per hour 1,5% of average investment/hours per annum
 - 7) Interest cost per hour 8,5% of average investment/hours per annum
 - 8) Repairs and maintenance cost per hour % of purchase price/life period in hours—as per table

14. SELF-PROPELLED COMBINE HARVESTERS

14.1a Maize combine harvesters—engines

Engine size (kW)	Average purchase price (R)	Salvage value (R)	Average investment (R)	Depreciation (R/hr)	Insurance and licence (R/hr)	Interest (R/hr)	Total fixed costs (R/hr)	Total fixed costs excl. interest (R/hr)	Repair and maintain. - Notes**
- 1) Life 4 000 hours
 - 2) Average use per annum 300 hours/annum
 - 3) Salvage value 10,00% of purchase price
 - 4) Average investment = (Purchase price + salvage value)/2
 - 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
 - 6) Licence and insurance cost per hour 1,75% of average investment/hours per annum
 - 7) Interest cost per hour 8,5% of average investment/hours per annum
 - 8) Repairs and maintenance cost per hour 40,00% of purchase price/life period in hours
 - 9) Fuel price 13,27 per litre (as at 15/08/2013)
 - 10) Fuel consumption 60,00% of kilowatts used
 - 11) Litres used per kilowatt hour 0,3 litre/kW hour

14.1b Maize combine harvesters—heads

Notes	1) Life	4 000	hours
	2) Average use per annum	300	hours/annum
	3) Salvage value	10,00%	of purchase price
	4) Average investment	= (Purchase price + salvage value)/2	
	5) Depreciation cost per hour	= (Purchase price - salvage value)/life period in hours	
	6) Licence and insurance cost per hour	1,75%	of average investment/hours per annum
	7) Interest cost per hour	8,5%	of average investment/hours per annum
	8) Repairs and maintenance cost per hour	40,00%	of purchase price/life period in hours

The cost of an engine and a suitable head are calculated by selecting the relevant engine costs (14.1a) and adding the relevant head costs (14.1b).

There are other examples in the introduction (Table 2).

Notes

- 1) Life 4 000 hours
- 2) Average use per annum 300 hours/annum
- 3) Salvage value 10,00% of purchase price
- 4) Average investment = (Purchase price + salvage value)/2
- 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
- 6) Licence and insurance cost per hour 1,75% of average investment/hours per annum
- 7) Interest cost per hour 8,5% of average investment/hours per annum
- 8) Repairs and maintenance cost per hour 40,00% of purchase price/life period in hours

The cost of an engine and a suitable head are calculated by selecting the relevant engine costs (14.2a) and adding the relevant head costs (14.2b). There are other examples in the introduction (Table 3).

14.2c Wheat combine harvesters—engines and heads

Engine size (kW)	Head size	Average purchase price (R)	Salvage value (R)	Average investment (R)	Depreciation (R/hr)	Licence and insurance (R/hr)	Interest (R/hr)	Total fixed costs (R/hr)	Total fixed costs excl. interest (R/hr)	Repair and maintain. - Notes**
- 1) Life: Truck trailers 560 000 kilometres
 - 2) Average use per annum: Truck trailers 70 000 kilometres per annum
 - 3) Salvage value 25,0% of purchase price
 - 4) Average investment = (Purchase price + salvage value)/2
 - 5) Depreciation cost per kilometre = (Purchase price - salvage value)/life period in kilometres
 - 6) Insurance cost per kilometre 1,5% of average investment/kilometres per annum
 - 7) Actual licence cost per kilometre R 290 /kilometres per annum
 - 8) Interest cost per kilometre 8,5% of average investment/kilometres per annum
 - 9) Repairs and maintenance cost per kilometre 30,0% of purchase price/life period in kilometers
 - 10) Tyre cost per kilometre = (Purchase price of new tyre * no. tyres)/tyre life in kilometres [No. tyres = No. wheels]
 - 11) Tyre life: Assumed that a set of tyres lasts 45 000 kilometres
 - 12) It is assumed that 4 sets of tyres are needed

15.2 Tractor trailers with brakes

Description	Purchase price (R)	Salvage value (R)	Average investment (R)	Depreciation (c/km)	Insurance (c/km)	Licence (c/km)	Interest (c/km)	Total fixed costs (c/km)	Total fixed costs excl. interest (c/km)	Repairs and maint. - Notes
- 1) Life: tractor trailers 12 000 kilometres
 - 2) Average use per annum: Tractor trailers 1 000 kilometers per annum
 - 3) Salvage value 25,0% of purchase price
 - 4) Average investment = (Purchase price + salvage value)/2
 - 5) Depreciation cost per kilometre = (Purchase price - salvage value)/life period in kilometres
 - 6) Insurance cost per kilometre 1,5% of average investment/kilometres per annum
 - 7) Actual licence cost per kilometre R 290 /kilometres per annum
 - 8) Interest cost per kilometre 8,5% of average investment/kilometres per annum
 - 9) Repairs and maintenance cost per kilometre 30,0% of purchase price/life period in kilometres
 - 10) Tyre cost per kilometre = (Purchase price of new tyre * no. tyres)/tyre life in kilometres [no. tyres = no. wheels]
 - 11) Tyre life: Assumed that a set of tyres lasts 45 000 kilometres
 - 12) It is assumed that 4 sets of tyres are needed

15.3 Cane and timber loaders

Description	Purchase price (R)	Salvage value (R)	Average investment (R)	Depreciation (c/km)	Insurance (c/km)	Licence (c/km)	Interest (c/km)	Total fixed costs (c/km)	Total fixed costs excl. interest (c/km)	Repairs and maint. (c/km)	Tyre cost (c/km)	Total variable costs (c/km)	Total costs (c/km)	Total costs excl. interest (c/km)
<i>15.3.1 Cane loaders</i>														
46 kW	645 425	161 356	403 391	40,34	3,03	17,14	60,51	43,36	32,27	92,89	2,08	127,24	187,75	170,61
<i>15.3.2 Timber loaders</i>														
46 kW	658 878	164 720	411 799	41,18	3,09	17,50	61,77	44,27	32,94	92,89	2,08	127,92	189,69	172,19

- Notes**
- 1) Life: Cane loaders 12 000 kilometres
 - Life: Timber loaders 12 000 kilometres
 - 2) Average use per annum: Cane loaders 2 000 kilometres per annum
 - Average use per annum: Timber loaders 2 000 kilometres per annum
 - 3) Salvage value 25,0% of purchase price
 - 2) Average investment = $(\text{Purchase price} + \text{salvage value})/2$
 - 3) Depreciation cost per hour = $(\text{Purchase price} - \text{salvage value})/\text{life period in hours}$
 - 4) Insurance and licence cost per hour 1,5% of average investment/hours per annum
 - 5) Interest cost per hour 8,5% of average investment/hours per annum
 - 6) Repairs and maintenance cost per hour 60,0% of purchase price/life period in hours
 - 7) Fuel price = 13,27 per litre
 - 8) Fuel consumption: 46 kW 7,00 Litres/kilowat hour
 - 9) Oil price = 29,76 per litre
 - 10) Oil consumption = 1,0% of fuel consumption
 - 11) Tyre cost per hour = $(\text{Purchase price of new tyre set} * \text{no. tyre sets})/\text{hours per annum}$
 - 12) It is assumed that 6 sets of tyres are needed

16. TRAILERS

16.1 Two-wheeled trailers

- Notes**
- 1) Life period 10 000 hours
 - 2) Average use per annum 500 hours
 - 3) Salvage value 5% of purchase price
 - 4) Average investment = (Purchase price + salvage value)/2
 - 5) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours
 - 6) Insurance cost per hour 1,5% of average investment/hours per annum
 - 7) Actual Licence cost per hour = Actual cost/hours per annum
R 200,00 /hours per annum
 - 8) Interest cost per hour 8,5% of average investment/hours per annum
 - 9) Repairs and maintenance cost per hour 40% of purchase price/life period in hours
 - 10) Tyre cost per hour = (Purchase price of new tyre set * no. tyre sets)/life period in hours
 - 11) It is assumed that 3 sets of tyres are needed

- 6) Insurance cost per kilometre 4,00% of average investment/kilometres per annum
- 7) Actual licence cost per kilometre = Actual cost/kilometres per annum Group 18,1,3,0 t 1 400 Group 18,1,7,0 t 2 898 Groups 18,1 and 18,4 4 640 Group 18,1,4,0 t 1 940 Group 18,1,8,0 t 3 312 Groups 18,3, 18,5 and 18,6 4 500 Group 18,1,6,0 t 2 482
- 8) Interest cost per hour 8,5% of average investment/kilometres per annum.
- 9) Repairs and maintenance cost per hour 50,0% of purchase price/life period in kilometres for 3 to 5 ton trucks 60,0% of purchase price/life period in kilometres for all other trucks
- 10) The price of diesel = 1 327 cents/litre
- 11) Fuel cost/km = Fuel consumption * fuel price
- 12) Price of oil = 2 976 cents/litres 6 249,6 Rand/210 litres
- 13) Oil consumption = 1,5% of fuel consumption for the 3-5 ton trucks 2,0% of fuel consumption for all the other trucks
- 14) Tyre cost per kilometre = (purchase price of new tyre * no. tyres)/tyre life in kilometres [No. tyres = no. wheels] = (Total price of new tyres)/tyre life in kilometres
- 15) Assumption: A set of tyres lasts 45 000 kilometres
- 16) A contingency factor of 10,0% of the variable costs, i.e. repairs + fuel + oil + tyres

19. ELECTRIC MOTORS

19.1 Electric motors—1,1kW to 4,0 kW—1 000 rpm 6-pole high efficiency

Notes	1) Average life	20 000	hours
	2) Salvage value	10,00%	of purchase price
	3) Average investment	= (Purchase price + salvage value)/2	
	4) Depreciation cost per hour	= (Purchase price - salvage value)/life period in hours (in cents/hour)	
	5) Interest cost per hour	8,5%	of average investment/hours per annum (in cents/hour)
	6) Repairs and maintenance cost per hour	10,00%	of purchase price/life period in hours (in cents/hour)
	7) KVA needed (power factor)	85,00%	of kW size
	8) Weighted average for land rates	0,8	R/kW hr
	9) Cost	= Size (kW) x KVA needed x weighted average (in Rand/hour)	
10)	Transformer size for land rate 1	25	KVA
	Transformer size for land rate 2	50	KVA
	Transformer size for land rate 3	100	KVA
11)	As the required KVA approaches the allotted land rate transformer size, the user is compelled to use a higher capacity.		
12)	Note these costs are only guidelines and each new electrical installation will need its own evaluation.		
13)	Each new connection must be evaluated against the current use of the transformer to be used.		

19.2 Electric motors—5,5kW to 18,5 kW—1 000 rpm 6-pole high efficiency

Notes

- 1) Average life 20 000 hours
 - 2) Salvage value 10,00% of purchase price
 - 3) Average investment = (Purchase price + salvage value)/2
 - 4) Depreciation cost per hour = (Purchase price - salvage value)/life period in hours (in cents/hour)
 - 5) Interest cost per hour 8,5% of average investment/hours per annum (in cents/hour)
 - 6) Repairs and maintenance cost per hour 10,00% of purchase price/life period in hours (in cents/hour)
 - 7) KVA needed (power factor) 85,00% of kW size
 - 8) Weighted average for land rates 0,8 R/kW hr
 - 9) Cost = Size (kW) x KVA needed x weighted average (in Rand/hour)
 - 10) Transformer size for land rate 1 25 KVA
 - Transformer size for land rate 2 50 KVA
 - Transformer size for land rate 3 100 KVA
 - 11) As the required KVA approaches the allotted land rate transformer size, the user is compelled to use a higher capacity transformer.
 - 12) Note these costs are only guidelines and each new electrical installation will need its own evaluation.
 - 13) Each new connection must be evaluated against the current use of the transformer to be used.

20. FIELD CAPACITIES OF AGRICULTURAL MACHINERY

20.1 Introduction

The field capacity in ha/10-hour day = Speed in km/h x working width in m x N.

Where N = Field Efficiency, which is measured as a decimal. The field efficiency factor allows for time spent on turning on the headlands, refuelling the tractor, filling seed and fertiliser bins on a planter, etc. In the table of field capacities in the next section, average field efficiencies for the different operations are given. In practice, this figure might differ from the actual values, depending on how efficiently the operations are carried out.

Example 1

A single-tine subsoiler is used at a speed of 5 km/hr and at a spacing of 2 m. From field observations it is determined that 17% of the time is spent on turning at the headlands and refuelling the tractor. Determine the field capacity.

$$\begin{aligned}\text{Working speed} &= 5 \text{ km/hr} \\ \text{Working width} &= 2 \text{ m} \\ \text{Field efficiency} &= 100 - 17 = 83\%, \text{ i.e. } 0,83 \text{ as a decimal} \\ \text{Field capacity} &= 5 \times 2 \times 0,83 \\ &= 8,3 \text{ ha/10-hour day}\end{aligned}$$

In the table of field capacities, the column "kW REQUIRED", gives an indication of the actual power required to carry out the operation at specified field capacity. It should be kept in mind that a naturally aspirated engine working under Highveld conditions can only deliver approximately 80% of its rated power as measured at sea level. A turbo charged engine is assumed not to lose any power with an increase in altitude. Therefore, if the table indicates that 40 kW is required, a tractor with an advertised rated power of $40/0,8 = 50$ kW has to be used. If the tractor is fitted with a turbo charger, a 40 kW turbo-charged tractor would suffice.

At some places in the table of field capacities a recommended tractor size is specified. This is for certain operations where the physical size of the tractor, and not the power of the tractor determines the field capacity for the operation. An example of such an operation is the use of a high speed planter where a smaller tractor is unstable at high speeds although sufficient power is available. The lifting capacity of a three-point hitch may also be a limiting factor in certain operations.

The data in the table of field capacities can be adjusted to suit the specific requirements by interpolation between the work rates for the machines. If for instance, a 55 kW tractor is available and the work rate for ploughing in a sandy soil has to be determined, it can be done as follows:

Available kW at Highveld altitude

$$\begin{aligned}&= 0,8 \times 55 \\ &= 44 \text{ kW}\end{aligned}$$

From the field capacities listed for a mouldboard plough it can be seen that 48 kW is required to plough 10 ha per day.

The field capacity of a 44 kW tractor will be:

$$\begin{aligned}\text{Field capacity (ha/10-hour day)} &= (10 \text{ ha/day} \times 44 \text{ kW}) \div 48 \text{ kW} \\ &= 9,2 \text{ ha/day}\end{aligned}$$

In the table of field capacities, provision has been made for three soil types, namely sandy, sandy-loam and clay-loam. This classification is very broad and the work rates have to be modified for ploughing in the specific soil and comparing these with the listed field capacities. The tabulated figures can then be adjusted for the specific soil type.

J. PRETORIUS & A.J. HEYNES, Pr. Eng.

Directorate: Agricultural Engineering

	6,0 m	26	35	33		46			

21) TRANSPORT

No measurements have been made of the required power.

For a tractor and trailer the following can be used to calculate approximate fuel consumption:

Terrain	Fuel consumption/litre per ton-km
Flat	0,05
Undulating	0,10
Hilly	0,15
